

A few more examples w/ recursion.

Permutations (bijective functions (1-1 onto)
from a set to itself.)
(finite)

Another way to think of it is all
re-orderings of a list.

Ex: Say list = 1 2 3.

Then permutations of 1 2 3 are

1	2	3
2	1	3
1	3	2
3	1	2
2	3	1
3	2	1

For a list of size n ,
there are $n!$ permutations.

Idea: For every element, give it a turn to
be last, and permute the first $n-1$
elements in all possible ways.

Base case? Say $n=1$ ($n = \text{size of list}$)
 $L = [1]$

Then $\text{perms}(L) = [[1]]$.

Sketch in C++: ($n = L.\text{size}()$)

```
vector<vector<int>> perms(vector<int> L)
```

```
{  
    if (L.size() == 1) {  
        vector<vector<int>> p;  
        p.push_back(L);  
        return p;  
    }
```

```
    int n = L.size();  
    vector<vector<int>> p; // ret. val.
```

```
    for (int i = 0; i < L.size(); i++) {  
        // put L[i] last;  
        swap(L[i], L[n-1]);
```

```
        int x = L[n-1];
```

```
        L.pop_back();
```

```
        vector<vector<int>> T = perms(L);
```

```
        for (j = 0; j < T.size(); j++) {
```

```
            T[j].push_back(x);
```

```
            p.push_back(T[j]);
```

```
        }
```

```
    L.push_back(x);  
    swap(L[i], L[n-1]);
```

```
}
```

```
return p;
```

```
}
```
